

Amendments to the Specification

At page 17, lines 1-14, correct the paragraph as follows.

The present invention provides great flexibility as to the selection of materials for the different components of the filtration module. Bonding compatibility is not necessary between any of the components. This means, for example, that a ~~relative~~ relatively soft and flexible material could be used for filtration insert 1 or parts thereof, while a relatively rigid and strong material could be used for the sleeve housing 2". Gasket 7 could even be integrated into support plate 6 and/or upper plate 12 of the filtration insert. Gasket 7 could thus have the form of a ridge at the periphery of membrane support plate 6 and/or upper plate 12 and be formed from the same material as the rest of the parts 6 and 12.
